FoliaTrace AI

Your words. Your bottle. Evidence your pharmacist can use.

Start with the words a person actually remembers

Ray calls it "my cholesterol pill." FoliaTrace AI interprets his description, connects his supplement ingredients to the relevant NIH quotation and prepares a brief for his pharmacist. His words, the suggested medicine group and the confirmation question stay together.

From the label to the pharmacy

1. Add the bottle	2. Describe the medicines	3. Bring the evidence
Search NIH labels, paste ingredients or review text read from a photo.	Use names, brands or everyday descriptions. Add the goal for the supplement.	Share the brief by QR, print it or download the details you choose.

On-device embeddings + cross-encoder reranking

MiniLM sentence embeddings match medicine descriptions to likely groups. BM25 finds candidate studies, and a MiniLM cross-encoder reranks them for the bottle and goal. The library contains 423 open-access abstracts. Each lead shows the study's own wording beside the bottle label.

Measured performance

37/39

Medicine descriptions matched to the correct group, with 0 wrong assignments.
54 synthetic English phrases.

96.3%

Exact-species precision.
789 held-out NIH labels.

74

NIH passages verified word for word.
25 covered herbs.

Medicine descriptions, goals and photos stay on your device. The models run in your browser.
